## IN THE CLAIMS:

- 1. (original) A load-balancing unit adapted to apply fuzzy logic rules to sets of fuzzified network-related indicator values and to generate a selection index associated with each set of indicator values.
  - 2. (original) The unit as in claim 1 wherein the unit comprises a load balancing switch.
  - 3. (original) The unit as in claim 1 wherein the unit comprises a load balancing router.
  - 4. (original) The unit as in claim 1 wherein the unit comprises a programmed media.
- 5. (original) The unit as in claim 1 further adapted to direct a request to a server associated with one of the generated selection indices.
- 6. (original) The unit as in claim 5 further adapted to direct a request to a server associated with a highest selection index.
- 7. (original) The unit as in claim 1 wherein each set of network-related indicator values is associated with a server.
  - 8. (original) The unit as in claim 1 wherein the fuzzy logic rules comprise 27 rules.
- 9. (original) The unit as in claim 1 wherein the network-related indicator values comprise dynamic, time-dependent indicator values.
- 10. (original) The unit as in claim 1 wherein the indicator values comprise values associated with a response time, a number of active connections and a delivered throughput.
- 11. (original) The unit as in claim 1 further adapted to generate an area associated with each fuzzy logic rule.
- 12. (original) The unit as in claim 11 further adapted to generate an aggregate area from a combination of areas associated with the fuzzy logic rules.

- 13. (original) The unit as in claim 12 further adapted to generate the selection index from the aggregate area.
- 14. (original) The unit as in claim 12 further adapted to generate the selection index from a center of gravity of te aggregate area.
- 15. (original) A method for selecting Internet servers comprising:

  applying fuzzy logic rules to sets of fuzzified network-related indicator values; and
  generating a selection index associated with each set of fuzzified network-related indicator
  values.
- 16. (original) The method as in claim 15 further comprising directing a request to a server associated with one of the generated selection indices.
- 17. (original) The method as in claim 16 further comprising directing a request to a server associated with a highest selection index.
- 18. (original) The method as in claim 15 wherein each set of network-related indicator values is associated with a server.
  - 19. (original) The method as in claim 15 wherein the fuzzy logic rules comprise 27 rules.
- 20. (original) The unit as in claim 15 wherein the network-related indicator values comprise dynamic, time-dependent indicator values.
- 21. (original) The method as in claim 15 wherein the indicator values comprise values associated with a response time, a number of active connections and a delivered throughput.
- 22. (original) The method as in claim 15 further comprising generating an area associated with each fuzzy logic rule.

- 23. (original) The method as in claim 22 further comprising generating an aggregate area from a combination of areas associated with the fuzzy logic rules.
- 24. (original) The method as in claim 23 further comprising generating a selection index from the aggregate area.
- 25. (currently amended) The method as in claim 23 further <u>comprising comprises</u> generating each selection index from a center of gravity of the aggregate area.
